**Description****BACKGROUND OF THE INVENTION****5    Field of the invention**

This invention relates to novel sulfoxide derivatives and processes for the preparation of the same.

**Description of prior art**

10    It is well known in the art to which the present invention relates that H<sup>+</sup> + K<sup>+</sup>ATPase plays a principal role in the final secretion mechanism of gastric acid in stomach cells [Scand. J. Gastroenterol., 14, 131-135 (1979)]. As a substance having H<sup>+</sup> + K<sup>+</sup>ATPase inhibitory activity, Norinium bromide is known [Proceeding of the Society for Experimental Biology and Medicine, 172, 308-315 (1983)].

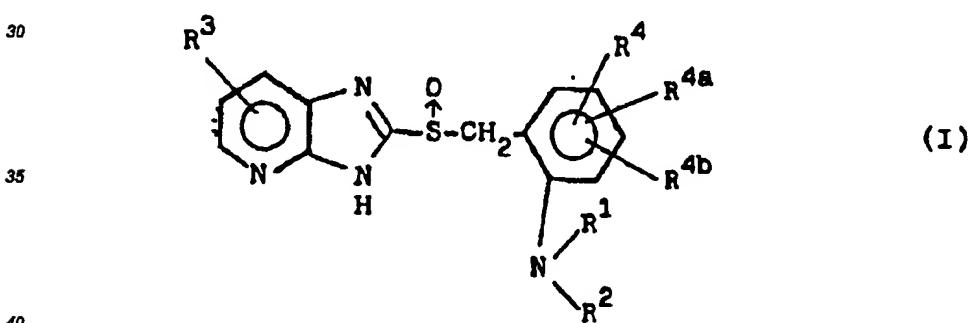

15    On the other hand, 2-[2-(3-dimethyl-4-methoxy)-pyridylmethylsulfinyl]-5-methoxy-benzimidazole [trade-name : Omeprazole] has been developed as an antiulcer compound having H<sup>+</sup> + K<sup>+</sup>ATPase inhibitory activity [Am. J. of Physiol., 245, G64-71 (1983)]. It is also known from GB 2161160 that certain other heterocyclic sulphonyl compounds display gastric-secretion-inhibiting activity,

The present invention is further described by the following examples.

(1)  $H^+ + K^+$ ATPase inhibitory effect

Following the method of Forte et al [J. Applied Physiol., 32, 714-717 (1972)], gastric acid secretory cells of a rabbit gastric mucosa were isolated and vesicle containing  $H^+ + K^+$ ATPase was prepared by centrifuging the cells in Ficoll discontinuous density gradient. After the enzyme was incubated at room temperature for 25 min. in 0.5 ml of a solution which contained 5 mM of an imidazole buffer (pH 6.0) and  $2 \times 10^{-4}$  M of each test compound, the mixture was heated to 37°C at which it was allowed to stand for further 5 min. To the mixture was added 0.5 ml of a solution which contained 4 mM of magnesium chloride, 80 mM of an imidazole buffer (pH 7.4), 20 mM of potassium chloride and 4 mM of ATP. The resulting mixture was caused to react at 37°C for 15 min., and 1 ml of a 24% solution of trichloroacetic acid was then added to terminate the reaction. The inorganic phosphorus liberated was quantitatively analyzed by the method proposed by Taussky and Short [J. Biol. Chem., 202, 675-685 (1953)]. The  $K^+$ -dependent activity of the ATPase was determined by subtracting its activity obtained when no potassium chloride was contained. The results are set forth in Table 1 in which Compound Nos. 1-7 are the sulfoxide derivatives prepared in the hereinafter-described Examples 1-7, respectively.

(2) Inhibitory action against secretion of gastric acid

45

Male Donryu rats having a body weight of 200 to 250 g and fasting (while allowing free access to water) for 24 hours were employed for the present test which was performed in accordance with the conventional method [Shay, H. et al, Gastroenterology, 5, 43-61 (1945)].

Under ether anesthesia, the pylorus of the rat was ligated and each test compound was administered intraduodenally. Four hours later, each rat was killed and the stomach was removed to collect the gastric juice. The inhibitory action was determined by comparing the acid output which was obtained by titration to pH 7.0 with 0.1-N NaOH by means of an automatic titrator, with the corresponding value of a control rat prepared in the same manner except that a vehicle alone was administered. The results are set forth in Table 2.

(3) Inhibitory actions on gastric lesion models

40 Two different types of gastric lesion models were induced in male Donryu rats (180 to 240 g) which had been deprived of food but allowed free access to water for 24 to 48 hours prior to experiments.

(a) Water-immersion stress-induced erosions :

45 Rats fasted for 24 hours before experiments were placed in a restraint cage. The animals were immersed vertically to the level of the xiphoid process in a water bath (21°C) for 7 hours and then killed. The stomach of each rat was removed and inflated by injecting 10 ml of 1% formalin to fix the inner and outer layers of the gastric walls. This formalin treatment was performed in all of the following experiments. Subsequently, the stomach was incised along a greater curvature and examined for any erosion in the glandular portion. Each test compound or a vehicle alone was given orally 10 minutes before stressing.

(b) HCl-ethanol-induced erosions

50 A hydrochloric acid-ethanol solution (150 mM HCl in 60% ethanol) was given orally to rats in a dose of 1 ml/200g, which rats had been fasted for 24 hours before experiments. One hour later, each animal was killed and the stomach was examined for any erosion in the glandular portion. Each test compound or a vehicle alone was given orally 30 minutes before ethanol treatment.

The results are shown in Tables 3 and 4.
